Numerical Simulation
of
Space Plasmas

M. Lotzmann, Braunschweig

Numerical simulation of space plasmas

1. Introduction
 - 1.1. Systems and objects
 - 1.2. Kinds of equations
 - 1.3. Boundary conditions
 - 1.4. Examples

2. Basic equations
 - 2.1. Field equations
 - 2.2. Material equations

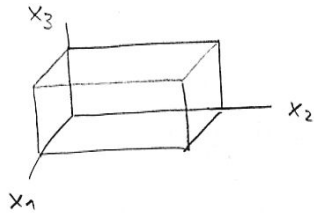

3. Applications
 - 3.1. Collisionless shocks
 - 3.2. Mass loading
 - 3.3. Comets
 - 3.4. Ion thruster
 - 3.5. Arc discharge plasma
(Hg and Xe lamps)

1. Introduction

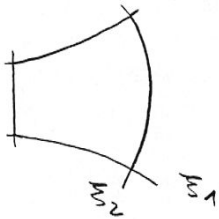

1.1. Systems and objects

System = domain in 3d space
= simulation box

- cartesian frame (x_1, x_2, x_3)

- curvilinear frame (ξ_1, ξ_2, ξ_3)

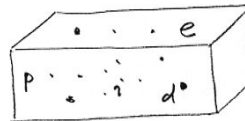

- domain is open (interaction with neighbourhood)

Objects = material + fields

- material: ionized gas
neutrals
dust particles

Microscopic view/
microscopic approach

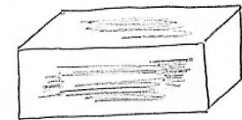

ensemble of small particles (points),
physical parameters:
mass
electric charge
position in space
velocity

⇒ particle description

Macroscopic view/
macroscopic approach

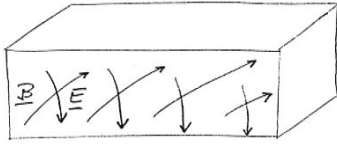

continuous gas or fluid,
physical parameters:
mass density
charge density
pressure
streaming velocity

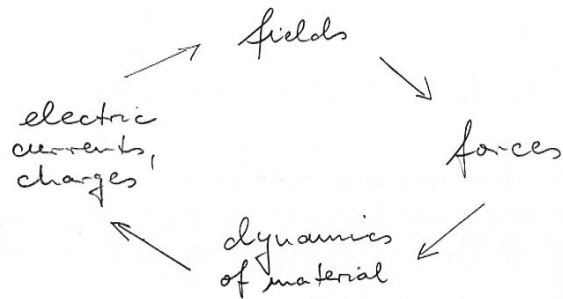

⇒ fluid description

- Fields: electric field $\underline{E}(x, t)$
magnetic field $\underline{B}(x, t)$
 \Rightarrow Lorentz force

$$\underline{F}(x, t) = q(\underline{E} + \underline{v} \times \underline{B})$$

- Interaction of material and fields

- Computational plasma physics / numerical plasma simulation is the numerical handling of this cycle

1.2. Kinds of equations

- Field equations ($\underline{E}, \underline{B}$)

Maxwells equations,
up to 8 partial differential equations

- Material equations

- (a) Fluid description

1 set of typically 5 equations for each fluid component (species),
2 ... 3 ... components (electrons, protons, heavy ions, charged dust particles, ...),
typ of equations: Navier-Stokes.

- (b) Particle description

- Individual particles: $\sim 10^6$ O.D.E
typ of equation: Newtons law

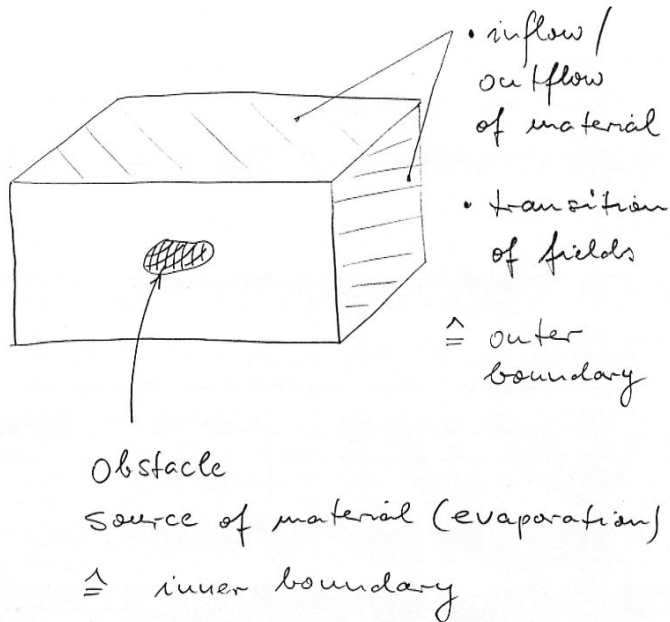

- (c) - Particles are summarized by a distribution function:

typ of equation: Boltzmann, Vlasov

1.3. Boundary condition

- System is described by partial differential equations
→ boundary conditions are used fully

• Simulation box

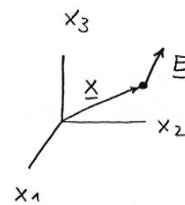

2. Basic equations

2.1. Field equations

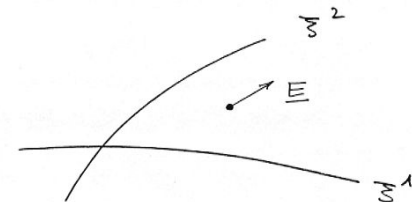

<u>Fields:</u>	$\underline{E}(x, t)$	electric field
	$\underline{B}(x, t)$	magnetic field
	$\underline{j}(x, t)$	current density
	$\rho(x, t)$	charge density

Frame:

Cartesian

Curvilinear

Constants (system of units: SI)

$$\epsilon_0, \mu_0, c = 1/\sqrt{\epsilon_0 \mu_0}$$

Maxwell's equations

Ampere's law:

$$\underline{\partial}_x \times \underline{B} = \frac{1}{c^2} \partial_t \underline{E} + \mu_0 \underline{j}$$

Faraday's law:

$$\underline{\partial}_x \times \underline{E} = -\partial_t \underline{B}$$

Gauss' law:

$$\underline{\partial}_x \cdot \underline{E} = \frac{1}{\epsilon_0} \rho$$

No name law:

$$\underline{\partial}_x \cdot \underline{B} = 0$$

\underline{j}, ρ sources of $\underline{E}, \underline{B}$

2.2. Material equations

(a) Fluid description

- regard one species (e.g. protons)

$n(x, t)$ particle density

$\underline{u}(x, t)$ streaming velocity

$p(x, t)$ pressure

Continuity equation:

$$\partial_t n + \underline{\partial}_x (n \underline{u}) = 0$$

Momentum equation:

$$\partial_t (n \underline{u}) + \underline{\partial}_x (n \underline{u} \underline{u}) + \frac{1}{m} \underline{\partial}_x p = q n (\underline{E} + \underline{u} \times \underline{B})$$

Pressure equation:

$$p = n k_B T$$

- analogous set for each species

- $S(x, t) = \sum_{\text{species}} q n(x, t)$

- $\underline{j}(x, t) = \sum_{\text{species}} q n(x, t) \underline{u}(x, t)$

(b) Particle description / Individual particles

- regard one species (e.g. protons)
- each particle gets a number: $p = 1, 2, \dots, 10^6, \dots$

$\underline{x}_p(t)$: position of particle p

$\underline{v}_p(t)$: velocity of particle p

- Particle motion

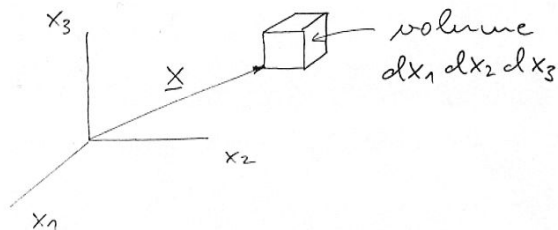

$$d_t \underline{x}_p = \underline{v}_p$$

$$d_t \underline{v}_p = \frac{q}{m} \{ \underline{E}(\underline{x}_p, t) + \underline{v}_p \times \underline{B}(\underline{x}_p, t) \}$$

- analogous set of equations for each species (electrons, heavy ions, charged dust, ...)

$$S(\underline{x}, t) = \sum_{\text{species}} \sum_{p \text{ in } dx_1 dx_2 dx_3} q$$

$$\underline{j}(\underline{x}, t) = \sum_{\text{species}} \sum_{p \text{ in } dx_1 dx_2 dx_3} q \underline{v}_p$$

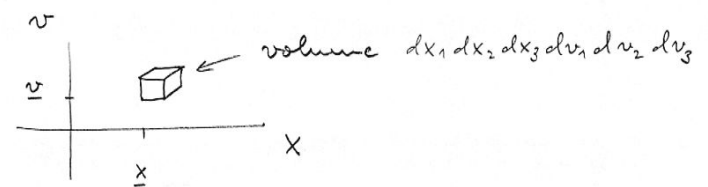

(c) Particle description / Particle distribution function

- regard one species
- introduction of distribution function

$F(\underline{x}, \underline{v}, t) \sim$ number of particles at position \underline{x} with velocity \underline{v}

- phase space (6 dim)

- Vlasov equation for each species

$$\partial_t F + \underline{v} \cdot \partial_{\underline{x}} F + \frac{q}{m} (\underline{E} + \underline{v} \times \underline{B}) \cdot \partial_{\underline{v}} F = 0$$

$$S(\underline{x}, t) = \sum_{\text{species}} \int q F(\underline{x}, \underline{v}, t) d^3 v$$

$$\underline{j}(\underline{x}, t) = \sum_{\text{species}} \int q \underline{v} F d^3 v$$
